

VOXY VOICE

AI Voice Employee for Businesses

Purpose: Give businesses a natural AI phone/voice employee that can answer customers, understand requests, recommend products, take orders and trigger approved business actions.

1. What Is Voxy Voice?

Voxy Voice is the voice version of the Voxy AI employee. A customer can call a business and speak naturally instead of typing. Voxy listens, understands the request, responds with a natural voice, and can use the same business information and tools available to the text-based Voxy agent.

Important: Voxy Voice is not just an AI receptionist. Its purpose is to help complete business tasks — especially customer service, sales and ordering.

Core abilities

- Answer inbound business calls.
- Understand natural customer speech.
- Answer questions using the business's real information.
- Recommend relevant products or services.
- Take and confirm orders.
- Generate an approved payment request.
- Check order/payment status through connected tools.
- Transfer or hand off to a human when necessary.
- Keep a record of the call and actions taken.

2. What the Business Provides

When a business creates Voxy Voice, it should provide the same core information used by the Voxy AI employee:

- Business name and logo
- Business description
- Products/services
- Product images and descriptions
- Prices and variants
- Opening hours
- Delivery/service areas
- Payment methods
- FAQs and business policies
- Human contact/escalation details

- Preferred voice/personality

The voice agent should never invent prices, availability, policies or successful actions. For critical information, Voxy should rely on the business database or connected tools.

3. The Call Experience

The experience should feel like calling a real receptionist or sales representative — short, warm and direct.

Opening example

Voxy: “Good afternoon, welcome to Mama Kitchen's Food. I'm Voxy, your virtual assistant. How can I help you today?”

If the customer says they want to order

Customer: “I'd like to order food for five people.”

Voxy: “Absolutely. We have a few options for five people. What kind of food are you looking for?”

If the customer asks a question

Customer: “Are you open today?”

Voxy: “Yes, we're open until nine tonight. Would you like to place an order?”

4. How Voxy Should Speak

Voice is different from chat. Customers cannot scroll back through what was said, so Voxy should keep each turn short and ask one question at a time. This is also consistent with current voice-agent design guidance.

■cite■turn0search0■turn0search1■

- Keep normal replies to one or two short sentences.
- Ask one question at a time.
- Listen after asking a question; do not keep talking.
- Use natural contractions and conversational language.
- Do not read long menus unless the customer asks.
- Say prices and numbers naturally when spoken.
- Repeat important details before completing an order.
- Match the caller's energy: fast when they are in a hurry, warmer when they want conversation.
- If unsure, ask for clarification instead of guessing.

Natural conversation

Voxy should sound conversational rather than like it is reading a script. Small natural phrases such as “Okay, got you,” “Sure,” “Let me check that,” and “Perfect” can make the interaction feel more natural — but they should not be overused.

5. Voxy Voice Sales & Order Flow

Customer request → Understand intent → Ask needed question → Recommend → Customer chooses → Confirm order → Create order → Payment → Verify → Confirm completion

Example

Customer: “I need something for six people, around twenty thousand naira.”

Voxy: “Got you. Our Family Jollof Combo is eighteen thousand five hundred and serves five to six people. Would you like chicken or beef?”

Customer: “Chicken.”

Voxy: “Perfect. So that's one Family Jollof Combo with chicken for eighteen thousand five hundred. Should I place that order for you?”

Customer: “Yes.”

Voxy: “Great. I'll create the order and prepare your payment option now.”

The system should confirm that an action actually succeeded before Voxy says it is complete. For example, Voxy should not say a payment was received until the payment system confirms it. ■cite■turn0search1■

6. How the Voice Agent Works Behind the Scenes

A practical Voxy Voice architecture has four main real-time parts: phone/voice connection, speech-to-text, the AI reasoning layer, and text-to-speech. A business knowledge layer and business tools sit around them so the agent can answer from real data and perform actions. ■cite■turn0search5■

Customer speaks	Voice input is received.
Speech understanding	Speech is converted/interpreted as text and intent.
Voxy brain	The agent uses conversation context + business knowledge to decide what to say/do.
Business tools	Catalogue, orders, payment, customer records and other approved actions.
Voice response	Voxy's response is converted to natural speech and played to the caller.

7. Voxy Voice — Core AI Instruction

The voice agent should have a structured system instruction. Current voice-agent guidance recommends defining identity/personality, response rules, guardrails, context, workflows and examples. ■cite■turn0search0■

Short Voxy Voice prompt concept

Identity: You are Voxy, the AI employee for [Business Name]. You help customers with questions, recommendations, orders and approved business tasks.

Personality: Friendly, confident, warm and professional. Sound like a helpful Nigerian business representative when appropriate to the business.

Speaking style: Keep replies short. Ask one question at a time. Listen carefully. Do not give long speeches. Use natural conversational phrases.

Sales behavior: Understand what the customer needs, recommend the best matching product, answer objections using business information, and guide the customer toward a purchase without being pushy.

Order behavior: Collect the required order details, repeat the final order and total, and ask the customer to confirm before creating the final order or initiating payment.

Truthfulness: Never invent prices, products, availability, discounts or payment status. Use connected tools for information that must be accurate.

Human handoff: If the request is outside your capabilities or the customer asks for a human, transfer/escalate according to the business's rules.

8. Key Conversation Scenarios

A. General enquiry

"Hi, welcome to [Business Name]. I'm Voxy. How can I help you today?"

B. Product enquiry

"Yes, we have that available. It's [price]. Would you like me to tell you a little more about it?"

C. Recommendation

"If you're looking for something affordable for four people, I'd recommend [product]. Would you like to order it?"

D. Order confirmation

"Just to confirm, that's two [product], one [add-on], for a total of [amount]. Is that correct?"

E. Payment

"Perfect. I'll prepare your payment option now." Then confirm payment only after the payment system reports success.

F. Human handoff

"I want to make sure you get the right help. Let me connect you with someone from the team."

9. Voxy Voice MVP

- Inbound phone number / voice channel

- Business-specific AI prompt and knowledge
- Product/service catalogue access
- Natural voice conversation
- Customer intent detection
- Product recommendation
- Order creation
- Order confirmation
- Payment-link generation
- Payment-status verification
- Call summary and activity log
- Human handoff
- Basic multilingual support where supported

The first demo should focus on one complete flow — **call** → **conversation** → **recommendation** → **order confirmation** → **payment** → **business notification** — rather than trying to support every possible business task.

10. Product Goal

Voxy Voice should feel like calling a real employee who knows the business, understands the customer, can sell, and can actually get things done.
